📄 SUMMARY

Backend developer focused on Node.js/TypeScript systems, with hands-on experience designing REST APIs, fault-tolerant infrastructure, and relational databases. Built a custom API Gateway with 100% test coverage and CI/CD automation; led backend architecture on a full-stack platform serving real booking workflows.

</> TECHNICAL SKILLS

Languages & Runtime:

Node.js, TypeScript, JavaScript, SQL

Databases:

PostgreSQL, Prisma ORM, Redis, Schema Design

Testing:

Jest, Unit Testing, Integration Testing

Backend:

Express.js, REST APIs, Microservices, API Gateways, JWT Authentication, OAuth, Middleware

DevOps:

Docker, Docker Compose, GitHub Actions (CI/CD), Git

Real-time & Architecture:

Socket.IO, Circuit Breaker Pattern, Load Balancing, Fault Tolerance, Distributed Systems

📁 PROJECTS

Aegis, Custom API Gateway & Microservice Orchestrator

04/2026 – 05/2026

Node.js · TypeScript · Docker · Redis · Jest · GitHub Actions

- Eliminated cascading failures across a 9-service architecture by building a 3-state circuit breaker (Closed/Open/Half-Open) that auto-reroutes traffic and self-heals, reducing manual intervention during instance failures to zero.
- Prevented API abuse and overload by implementing a distributed Redis-backed rate limiter, sustaining reliable throughput under concurrent load.
- Shipped with 100% test coverage on core logic (Jest) and a GitHub Actions pipeline that auto-publishes Docker images to GHCR on every merge, cutting manual deploy steps to zero.
- Replaced the need for third-party tools like NGINX/Kong by designing the gateway, load balancer, and JWT middleware layer from scratch.

Wasselni, Full-Stack Carpooling Platform (Backend Lead)

03/2026 – 05/2026

Node.js · Express · TypeScript · PostgreSQL · Prisma

- Eliminated a critical overbooking bug by redesigning the seat-reservation logic with atomic database transactions and rowlevel locking, preventing double-bookings under concurrent requests.
- Led backend architecture for a multi-developer team, delivering JWT authentication, ride search/filtering, and full booking flow on a PostgreSQL + Prisma schema handling users, rides, vehicles, and bookings
- Built driver and passenger dashboards backed by a modular REST API architecture.

NodeTalk, Developer Social Network with Real-Time Chat

01/2026 – 02/2026

Node.js · Express · TypeScript · PostgreSQL · Prisma · GitHub OAuth

- Enabled real-time 1:1 messaging for users by implementing a Socket.IO chat layer on top of a relational PostgreSQL/Prisma schema.
- Reduced auth friction by supporting three sign-in paths (local credentials, guest access, GitHub OAuth) in a single multistrategy authentication pipeline.
- Modeled complex relational data (feeds, follow requests, user interactions) into a clean, query-efficient schema

🎓 EDUCATION

École Supérieure en Informatique (ESI-SBA)

Higher Education in Computer Science

09/2024 – Present
